SUMMARY:

This paper seeks to examine the assertion of the volleyball players with different somatic type in particular volleyball specializations. To determine the somatic type of individual players, necessary anthropometric measurements have been done being important for its elaboration. Further the percentage players’ fruitfulness in particular game activities was determined. For this purpose four regional volleyball matches were recorded and processed in detail. Professional literature dealing with the volleyball topics and somatic types was used as the source of information. The result of the elaborate will help to the volleyball teachers and coaches to group the players, according to their somatic type, into the specialization with the best possibility of their assertion. In addition the training can be accommodated to the somatic type and enable to increase the playing performance of the player.
