

The topic of my thesis is 'The problem of cochlear implantation in children and their inclusion in different types of elementary schools'. The first theoretical part deals with all elements around the process of cochlear implantation in the Czech republic. It is a relatively new and difficult subject which develops quickly and brings very important and interesting results. A child with a cochlear implant can be placed into schools for children with severe hearing disorders or mainstream kinds of schools, which gives evidence about how successful a cochlear implantation and a following rehabilitation can be. This is the reason why i am also interested in the subject of elementary education of children with cochlear implants. In the practical part of this thesis, i analyse the situation of placing of pupils with cochlear implants into different types of elementary schools, from the view point of selected factors which have a significant role for the asset of cochlear implants, for the life of the user. I survey the utilisation of cochlear implants by children from the view point of their school placing. I want to show a connection between monitored factors and the inclusion of children with cochlear implants into certain types of elementary schools. My thesis presents cochlear implantation as a very important a positive trend in the direction of education of children with severe hearing disorders.
