

In my bachelor thesis I directed on individual plants of tropics and subtropics and I pointed to their use in today's world.

I divided the work into some parts, which point to general characteristics of tropical and subtropical climate belt and I describe individual plants formations of the tropics and subtropics. In the next part are individual plants, where I pointed to their botanical characteristics, history and properties using and I added everything with their pictures. In the last part I summarized informations from the textbook of primary and secondary schools and arranged it in a tabular chart.
