

Reception of Darwin in biology conveys a story of evolutionary biology with emphasis on the divergent reception of Charles Darwin's theories by biologists in the past 150 years. Given the influence of Darwin's thought, a unique tradition has emerged in the scientific field. Every fifty years starting from the publishing of *The Origin of Species*, scientists gather to celebrate Charles Darwin as a thinker and a person. An immense amount of literature on Darwin and evolutionary biology has been produced by authors and publishers worldwide, thus the recurring commemorative events provide a fine start to the historical survey of Darwinism and are used as such in *Reception of Darwin in biology*.
