Ms. Blerina Shkodra focused her diploma thesis on the transfer of the method for determination of related substances of quetiapine from the conventional HPLC to the conditions of ultra-fast liquid chromatography. Experimental work was done mainly during her 4th year of study. She earned quickly laboratory skills and experience with HPLC apparatus and I was satisfied with Blerina´s attitude to this work. But she started write her thesis with long time distance, relatively late in the 5th year of study and it was the cause of some problems with the finishing her diploma thesis, because she has relatively short time for it and additionally several things were partially forgotten. It is a pity, because it had to influence my assessment of her diploma thesis. Regardless these facts it is my pleasure to recommend her diploma thesis for defence.
