

Abstract

This work focuses on the possibilities of accidents prevention and safe movement in the Czech water tourism in the comparison with the advanced preventive-safety system of tourist-mountaineering activities in Alpine countries.

I am concerned with the level of Czech safety system by finding out the number of persons to which the accidents and drownings on our rivers refer to in this work. Further on I consider whether a specific type of publication is successful on the market of water tourism and canoeing area as a mean to increase the safety, and which other kinds of means are used to reduce the quantity of accidents. I summarize which subjects are interested in this issue and by which manner they participate in improving the conditions on the water in the main part of this work. I suggest the possibilities of increasing the safety on Czech watercourses in the conclusion.

Following methods were used in this work: the method of induction on the basis of questionnaires, the method of processed results of dialogues with selected rental shops comparison and the descriptive statistical methods in the form of graphical analysis.

The water safety shifts forward by minor steps. Even the rental shops and further on the fire brigade or regions for example participate in the safety of their customers and water tourists. Perhaps the era when safe weirs are being made is near.
