**ABSTRACT:**

This thesis deals with the method of reflex locomotion and its impact on people with disability. The theoretical part describes the introduction to methods of reflex locomotion - its definition, history, indication, the course of therapy, developmental ontogeny, the therapeutic system, justifies the reasons for the failure of therapy. The practical part is focused on the use of methods of reflex locomotion to people with disability. It includes research and impact assessment methods reflex locomotion on selected components of special education children early and preschool age, and shows the results of research on the awareness, adoption and use of methods at home. The main objective is to determine whether the method of reflex locomotion effects on selected special education methods - fine and gross motor skills, graphomotor and drawings.

**KEYWORDS:**

method of reflex locomotion, people with disability, special educational diagnostics
