

Abstract

In this paper focusing on the subject of procrastination I have aimed on the phenomenon I noticed during studies of microeconomics course at IES, when the finished homework papers were submitted usually two hours before deadline. And I would like to clarify, what role played procrastination and its expectation in submitting of the homeworks and what part played cooperation between students during solving of these homeworks, this means how much is procrastination result of this common waiting game, where students are taking already completed parts of solution, and if this game is actually happening. This topic I am trying to answer with the tools of game theory.
