This thesis deals with the quality of life of patients with diabetic foot syndrome. The emphasis is on whether respondents comply with the therapeutic mode, and if and how their illness limits in everyday life. The work is divided into part of the theoretical and empirical.

The concept of quality of life appears and examines in different scientific disciplines since the mid-20th century. The first chapter the theoretical part of the work deals with the definition of the concept of and methods of the survey on the quality of life.

The second chapter covers the disease diabetes mellitus as a whole. This chapter has been included for better orientation in the subject and its consistency. In all directions, points out the importance of a good compensation for illness and compliance with therapeutic mode.

The third chapter expands upon the issue of diabetic foot syndrome. Informs you about the causes, symptoms, prevention, treatment and types of diabetic defects.

The aim of the empirical part of the work was to assess the quality of life of patients with diabetic foot syndrome. The respondents were selected according to the availability for a given time period from 1. 11.2011 to 31. 3.2012. Research was carried out in quantitative terms. The chosen research method was questionnaire. A total of 30 questionnaires were distributed, their return was 90%.

From the research investigation showed that in patients have difficulties in movement and the mundane day-to-day activities. More than 50% of respondents suffer from pain, whose intensity varies between 3-6 VAS.
