Abstract:

This thesis is divided in two parts – the general and the specialized one. In the general part it follows theoretical knowledge of problematics of unilateral endoprosthesis of knee joint implementation, different types of endoprosthesis, indications and gonarthrotis. Significant part is dedicated to physiotherapeutical procedures and means of treatment of patients after unilateral knee joint replacement. I dedicated the specialized part, elaborated in form of case interpretation, to a description of essential cooperation with the patient during the time of hospitalization, I determine short and long term plan and evaluate the effect of therapy.
