

## **Abstract**

According to some logicians and philosophers, future contingent propositions pose a specific problem. Many of those who look into this problem now and those who looked into it (even hundreds) years ago, refer to Aristotle. Nevertheless not in agreement.

Our aim is to give an overview of traditional and non-traditional interpretations of the part of Aristotle's work which deals with this issue. On the basis of their comparison we will try to uncover what causes the variety of readings. That will allow us to assess whether the truth of future contingent propositions really is a specific problem and what is its actual nature.
