

## Abstract:

This diploma thesis deals with the distribution of lithic raw materials in the Neolithic, whereas the main interest was focused on the area of Germany. The dispersion of chipped and polished stone artefacts in time and space was studied on the basis of available literature. The first part of this work presents existing knowledge about spreading specific types of lithic raw materials. The second part introduces sites from different federal states with finds of chipped and polished stone industry from which was it possible to determine the composition of lithic raw materials collections. The database is part of this work and includes catalogue of sites.
