

This diploma thesis, "The Analysis of 24 Month Old Child's Playing Interaction in His Family Background" (which is a part of grant's task number: 406/01/0220, whose solver is Doc. PhDr. L. Šulová, CSc.) has two main parts. The theoretical part comprises four bigger chapters, the first one includes different aspects of the family theme, the second one deals with early child's interactions and relationships in his family, the third part focuses on toddler's development characteristics, the fourth part deals with child's play and playing interactions. Empirical part presents results of a research, which aim was to look into and compare (quantitatively and qualitatively) playing interactions of 2 year old child with his mother, father (possibly older sibling) in family. For the analysis of videorecording the computer program V.I.P., which was developed for solving grant's task GA ČR by Ing. T. Hrdlička, was used. Some differences within single playing pairs and also within whole research group have emerged. The results are related only to the exploratory sample.
