

Abstract

This bachelors thesis deals with the assessment of skills in sign language. It includes a deep insight into the general issue of evaluation methods (especially of creating tests) as well as description of selected tests of sign language. Part of the work is devoted to modifications of existing tests to which process linguists and other experts now often tend. Also is introduced a specific modification procedure of selected sign language test into Czech sign language. This should serve in the future to a complete version of such test.
