

## **ABSTRACT**

This thesis is focused on research of the rondel (circular ditch) located in the Prague-Ruzyně area, dated to Late Neolithic Era with the Stroked Pottery culture. Quantitative, qualitative and spatial analysis of rondel's object fillings were carried out and the results and interpretation are presented in this thesis. Particularly thanks to Stroke-ornamented pottery analysis, it was possible to determine the relative chronology of the ditches filling. The interpretation of the material analysis and material spatial distribution tried to describe the trends associated with the formative processes and the development of origin of the ditches fillings. This work brings the results of processing of archeological findings and field documentation of a fully explored rondel, situated in the settlement of the Stroked Pottery culture. This work contributes to the understanding of Late Neolithic settlement structure and the rondels in general. Catalogue of findings is included.

## **KEY WORDS:**

Late Neolithic – Stroked Pottery culture – Circular ditch – spatial analysis – formation processes – pottery – lithics – daub – animal skeletal remains
