<b>Keywords:</b>	idiopathic scoliosis, ontogenesis, axial systém, reflexlocomotion

The thesis deals with the kinesiotherapy in idiopathic scoliosis taking into account the possibilities of Vojta method. It deals also with the history of this disease, incidence in the population, relation between ontogenetic development and development of the axial system. The thesis also describes the treatment options and introduces the most used method of kineziotherapy.

It contains two case studies of the patients with the idiopathic scoliosis where the Vojta method was used as the main method of kinesiotherapy.
