Cartographic processing of the data contained in the planning analytical materials

Abstract

The aim of this thesis is to point out the lack of cartographic expertise in text sections of planning analytical materials. Maps, which are placed into these materials, are assessed according to a technical and esthetical qualification. First part of this thesis contains interpretations of different methods of cartographic assessment. In this part we choose most acceptable method for this theme. In the next part of this thesis we use verbal assessment to assess cartographic works in planning analytical materials. Last part presents new maps, where has been applied the correct cartographic techniques and which can replace the old ones in those documents. These maps can also be used as patterns for cartographic application in planning analytical materials. The discussion deals with different views of municipalities to using cartography in these materials.

Key words: map, spatial analytical data, cartography, cartographic evaluation
