

## **ABSTRACT**

This dissertation explores the occurrence of symptoms of temporolimbic dysfunction with persons with mood disorder. Groups of patients was concerned to persons with depression and manic depression disorder. The occurrence of symptoms was examined by questionnaire method. It is assumed that mood disorders are result of damage of structures in the temporolimbic area and that they will also manifest in the questionnaires being used. Theoretical part describes anatomy of the temporolimbic area and temporolimbic dysfunction. Practical part is focused on the evaluation of the outcomes from submitted questionnaires.

## **KEY WORDS**
