

The topic of his thesis, A survey of patients treated for fractures in the ankle in 2005 I chose on the basis of their interest in the subject orthopedics and traumatology.

The issue of fracture-dislocations of the ankle is quite complicated and frequent occurrence.

Orthopedic - Traumatology Clinic of the Faculty Hospital in

Vinohrady in Prague in 2005, treated 261 patients with fractures of the ankle.

This means that on each working day is more than one fracture

hocks (2005 had 253 working days). Each case was among others

recorded in the questionnaire, with whom I then worked. We were interested in

what circumstances, at what age and what type of fracture occurs and how to treat.

Results for the year 2005, I had the opportunity to compare the results with certain categories from previous years.
