

The topic of his thesis Prevention of chronic hepatitis I chose both because of the interest in this issue and for providing opportunities for Precautionary question this current issue affecting not only professional, but especially the general public.

The aim of this work was to give a brief overview of the various etiologic agents involved in the development of chronic hepatitis. The text is devoted to attention essentially only chronic viral hepatitis, which may preventive measures apply most. Other chronic hepatitis are only listed in the Summary and below them are not given wider attention.

Preventive part is focused on general preventive measures against the spread of hepatitis vaccination against hepatitis B. The basis for the treatment of this topic was largely applicable legislation governing the issues.
