Téma práce: A Nursing Care of the Patient with Diagnosis Coronary Artery Disease after Surgery

Abstract:

The aim of the work is to report on the case of a 79-year-old patient after cardiac surgical intervention. The surgery was indicated for coronary artery disease. The clinical part deals with the characteristics and stages of ACD. It also deals with the diagnosis and treatments of UP (unstable angina). The next part describes the patient's hospitalization. The last part describes the palliative care of this patient, his psychological rehabilitation and his return to daily life. The nursing history is formulated according to the theory of Virginie Henderson. An important role in the reduction of complications is the education of patient.

Key words:

ACD, UA, nursing proces, Henderson's theory, aortocoronary bypass, Warfarin, methods of invstigation, self-sufficiency, self-care
