**Title:** Basal stimulation for people with profound mental disabilities

**Objectives:**

The goal is to track the response and the effects of the methods of basal stimulation for people with profound mental disabilities in a monthly interval. This is a method aimed at improving the perception of the body, the social relations and orientation in the surrounding environment.

**Methods:**

I watched how strong the response of nine clients with profound intellectual disabilities on the chosen method of basal stimulation, depending on the type and time. This is a qualitative method, which evaluates the best kinds of use of basal stimulation for people with profound mental disabilities. I chose the data collection involved observing the reactions of clients. Before the intervention, I tested the response to two kinds of methods, followed by a monthly intervention when I watched every day and write a response to nine selected persons to the application seven stimulation, which were practiced by therapists after the intervention, I tested the same method as before starting work. The project is carried out in public facilities for clients with annual, weekly, and daily tourist service.

**Results:**

The results showed that the observed bodies occurred after a monthly intervention to improve verbal and nonverbal communication, positive emotional manifestations, to a partial reduction of spasticity.

**Keywords:** basal stimulation, mental disability, the perception, body image
