ABSTRACT
The aim of the present thesis is to analyze the Norwegian existential construction (presenteringskonstruksjonen) with regard to syntax, static semantics, dynamic semantics, and functional sentence perspective (FSP). The thesis first introduces the firbasian FSP theory in general, demonstrating the concepts on Norwegian examples. Then the theories most relevant for the study of the existential construction are summarized. The analysis is carried out on a sample of 1000 instances (500 taken from fiction and 500 excerpted from academic prose), and focuses mainly on the notional subject, the verb, and a possible adverbial. The syntactic analysis includes the position and the structure of the notional subject and adverbials. In addition, the lexical semantics of the head words and static semantics of adverbials were observed. The FSP analysis focused on the FSP functions of the individual clause elements and the FSP patterns the existential construction may realize. In addition, the dynamic semantic roles were studied in relation to the static semantic roles. The aim of the analyses is to find out in what circumstances the existential construction may realize the presentation scale or the quality scale, and what functions the construction may perform. The thesis observes the application of FSP on real Norwegian texts and is therefore hoped to bring results applicable for pedagogical and translation purposes.
