

Law amendments are unreadable for normal people and do not provide the actual wording of the law. The complete versions of laws are usually published after several amendments, if at all. The amendments often contain sentences like “the dot is substituted by comma at the end of the paragraph, and words . . . are added”, “after the second sentence, insert the sentence . . .”, “the new wording of the paragraph number 12 is . . .”. The main goal of this work is to create an application that will be able to read a given law together with its amendments and create the complete version of the law. A few laws were chosen to test the application, and an accuracy of 95% has been achieved.
