

Abstract

This thesis is devoted to institution care for senior citizen, specifically retirements homes. At the beginning ageing and influence to society are being explored. Next chapter is devoted to age distribution in Prague and the future development up to 2030. Retirements homes in Prague is analysed by accommodation capacity, area, trend from 2000 and changes after enactment the law of social services. Analytical part of thesis is represented by survival analysis apply to selected retirements homes. This analysis is being carry out by Kaplan-Meier estimator of the survival function. An advantage of the Kaplan-Meier estimator is that the method can take into account censored data, where observation (deaths) doesn't exist.
