

# ABSTRACT

**Name of thesis:** Basal stimulation in occupational therapy

**Aim:** The aim of my thesis is to study the existing literature and find out, if there is any evidence, which can prove the effectivity of basal stimulation.

**Method:** In theoretical part I focus on resources, which evaluate effectivity of basal stimulation. In the practical part I work with two patients. I have obtained the detailed information about patients by observation, consulting the documentation and interviewing with the patients' families. At the Clinic of Anesthesiology and Intensive Care Medicine I have worked on the casuistries under the leadership of the therapist Ms. Dvořáková.

**Result:** Based on studying of the literature, I have found that the result of the research is especially the positive attitude of patients, but there is no proof that would confirm the effectivity of basal stimulation.

**Key words:** occupational therapy, basal stimulation, effectivity of basal stimulation, therapeutic unit, casuistry
