

Abstract

The thesis “Geocaching in Library – possibilities of using the phenomenon of geocaching in the library service” aims to create a specific methodological material about a connection of a public library to a geocaching system. The general part of the text covers a discussion about the geocaching phenomenon itself, as well as it describes GPS spaces and a process of inserting coordinates into records of geographical authorities. It continues with information about the application interface created for the geocaching community. The thesis proceeds to a description of existing caches and experience of founders of geocaching at the Czech and foreign libraries. The final part presents inspiring opinions and ideas from geocachers and librarians.
