Personal development and life prospects of children with hearing disorders

My bachelory work is divided in two parts – theoretical and empirical. In theoretical part basic definitions, types of hearing disorders and defects and diagnoses of children's hearing are described. In the next part, I inform about the compensatory aids for people with hearing disorders and ways of their communication. I also write in my thesis about personalities of these people, care of them and their integration into society.

The empirical part presents results of research, which was carried out on the basis of interviews. It is focused on interests and hobbies of children with hearing probléme, their ability to communicate and possibilities for profession choice . The work also maps their free time.
