Title: Comparison of the quality of life between pathological gamblers in treatment and without treatment - quantitative method

Abstract: The objective of my thesis is to survey and compare the quality of life of treated and untreated pathological gamblers, and examine how much their average score in particular domains of life differs from the population norm. The other objective ascertains which aspects of quality of life are influenced equally and which are influenced differently between Prague and Olomouc region. The last goal is to compare gambler's career in the SOGS questionnaire between treated and untreated gamblers. The thesis is processed with the quantitative method using the WHOQOL-BREF questionnaire on quality of life issue and SOGS questionnaire on pathological gambling. The data was processed with statistical methods in Microsoft Excel and entered into spreadsheets and graphs. Based on these results we can focus on prevention and improvement in working with gamblers. The thesis used literature and data from an addiction center.
