

Abstract:

This bachelor's thesis is focused on risk factors during the prenatal period and is divided into two main parts: a theoretical section, which is the principal part of the thesis, and a practical section. The theoretical section is primarily a literature overview and aims to present the main group of risk factors that may already affect the child in the prenatal period. The conclusion of this theoretical section is concerning with ways of monitoring the effects of these risk factors, especially genetic ones. The practical section is focused on designing a research project aimed at monitoring the relationship between prenatal maternal stress and any subsequent occurrence of infantile colic of the infant.

Keywords:

risk factors, prenatal period, infantile colic, prenatal stress
