Abstract

The diploma thesis analyses the impact of online behaviour on a real life. It is divided into a theoretical (chapters 1 to 3) and practical part (chapters 4 to 7). The first chapter introduces the current trends and generally the topic of social networks, the internet, online communication and relationships. The second chapter describes main forms of cyber antisocial behaviour. The third chapter is focused on the process of socialization and growing up from the point of view of developmental psychology. It also shows individual mental and behavioural frames of the cyber reality which penetrates the real world. The practical part deals in four chapters with different forms of a research which aim was to verify outlined hypotheses and facts mentioned in the theoretical part. The selected methods are quantitative research among high school students distributed through questionnaires, the qualitative interviews among high school teachers and the quantitative analysis of the educational journal. The fourth chapter describes theoretically the methodology of the research. The last three chapters document each part of the research, partially verify the outlined hypothesis and interpret the results.
