

Abstract

Title of bachelor`s thesis: The case study of physiotherapeutic treatment of a patient with a diagnosis of total hip replacement

Aims: The aim of this Bachelor thesis has been to improve theoretical knowledge and practical skills connected with the diagnosis of total hip replacement and with various physiotherapeutic methods used after the implantation of an artificial hip joint.

Summary: The thesis is divided into two parts. The first, general part deals with the anatomy and kinesiology of the hip joint as well as with coxarthrosis as the most frequent cause leading to the total hip replacement, and with operating approaches and particular types of implants mostly used in practice. Important part of the first section is the rehabilitation plan used in patients afflicted with this diagnosis, which includes preoperative rehabilitation, early rehabilitation after the operation, as well as subsequent curative rehabilitation. The second, specialist part deals with the casuistry of a patient submitted to the implantation of an artificial hip joint, including an assessment of the effects of the chosen therapy by comparing the kinesiological analyses before and after the treatment.

Key words: case study, hip joint, total hip replacement, physiotherapy, coxarthrosis
