Title:	Psychosomatic approach in general practitioner's office
Supervisor:	MUDr. Skorunka David, Ph. D.
Number of pages:	110
Number of appendixes:	6
Year of defense:	2014

Keywords: practising, psychosomatic disorders, stress, psychosocial factors, patient

Practitioner's surgery is a part of primary care and as such, it plays an important role in diagnostics of psychosomatic disorders. In the theoretical part I dealt with historical development and psychosomatic conceptions, explanation of causes and symptoms of the psychosomatic disorders. The next part is dedicated to themes, which comprise the basis of psychosomatic approach – the relationship between a medic and a patient, diagnostics and types of healing of these disorders. In the end I focused on specifics of the job of general nurse in the surgery and her contribution during application of psychosomatic approach.

The focus of this bachelor thesis is quantitative research performed by means of questionnaire investigation of two groups of patients – patients of practitioner without psychosomatic education and patients of psychosomatically educated practitioner. Data are processed graphically and statistically. For comprehensive view of psychosomatic approach in the surgery of practitioner I also performed quantitative research by means of semistructured interviews with the doctors from both surgeries.
