ABSTRACT

In this dissertation we propose a novel ontological point of view representing inner dimension of being and its interaction based on the phenomenology, quantum physics, psychoanalytic methodology and cognitive metaphor theories. Empirical findings about the phenomenology of interaction, gained from the natural language, open a new dimension of scientific research and interreligious discussion. Comprehension system of inner semantics leads us to a deeper understanding of the world of being. Essential Self interaction, described by cognitive metaphor and allows us identification of universal structure hidden beyond the language. Acquired linguistic data suggest that mind’s metaphoric self-reflection semantics closely correlate with a concept of entangled quantum particles and light binding phenomena. This theory gave us a unique opportunity to visualize the probabilistic picture of mind itself within an interdisciplinary approach of cognitive and philosophical studies.
