

## **Abstract in English**

The submitted thesis addresses the processing of material culture from the archaeological excavation in Velké Přílepy (district of Prague-west), where the settlement of Funnel Beaker culture was uncovered. The study is a sequel to my bachelor's thesis (defended in 2010) which evaluated only one part of the excavated settlement and significantly improves its corpus of finds. Therefore there is now a complete analysis of the whole widespread settlement area in an open position without any fortification. Close to sixty structures were documented and dated (based on ceramic analysis) to the Sirem and Salzmündphase of Funnel Beaker culture on this researched area. Thanks to the excavation, an exceptionally rich collection of ceramic production from the Early Eneolithic period (10 105 pieces altogether) exists. Other settlements belonging to the Funnel Beaker culture in the vicinity of Velké Přílepy are also considered in this thesis. Together with this settlement, they create a unique area of settlements of the aforementioned culture.
