

Abstract

The aim of this thesis is to present, analyse, compare and evaluate the current state of digital repositories at universities in the Czech Republic that use a software application for their digital repository. A theoretical part, which introduces the reader into the issue of compilation and operating of digital repositories in the Czech academic context, precedes the practical research. The crucial chapter of the practical part are the results of the actual analysis. The results of a supplementary survey of universities that do not run a digital repository with usage of software application and choose a different way of storage and access to their grey literature draw on the results of this analysis. The conclusion of the entire thesis is the outline of future development of the investigated issue and the perspective of further progress of the Czech academic milieu.
