

ABSTRACT

This master's thesis is about disposal of municipalities Chudobín and Korouhvice, which ceased to exist in due to the construction Víř reservoir. While Chudobín brought the waterworks building complete extinction, for Korouhvice this reservoir construction wasn't so totally destructive - above the flood plain territory of the waterworks were built five new houses which were inhabited by indigenous people. The construction, which was built on the river Svratka in the 50's has very deep impact on human destinies and become one of the basic and essential element in that region. This thesis explores the historical development and character of both the flooded villages, river Svratka itself and even the idea of the construction and the actual implementation of that waterwork. A separate part of this thesis consists of the liquidation process itself, from its own preparations through depriving or buyout to search for new housing. The final part is about the development after finishing works on the reservoir - the new Korouhvice, life near the dam and restrictions imposed by the protection zone around the reservoir flow.

KEYWORDS

Svratka, Víř's dam, Chudobín, Korouhvice, liquidation, oral history.
