Abstract

Title: Intermission of the game on the grounds of breaking the rules in young-junior boys categories.

Objectives: This diploma thesis aims to find out intervals of the game and intervals of the intermission of the game in young-junior basketball and youth boys basketball matches, and to compare the detected data. The other aim is to discover the reasons leading to the intermission of the game of each category during these matches.

Methods: As a research method, the method of observation of the video recordings of youth basketball and young-junior basketball matches from the website tvcom.cz was chosen. Using the basic statistic and arithmetic methods, the measured data were processed statistically and, consequently, graphically also.

Results: It was discovered that children playing the young-junior basketball have the shortest average interval of the continuous game in all studied categories and that this interval is shorter than the interval of the average duration of the intermission of the game during young-junior basketball matches. The most frequent reason for the intermission of the game in all categories is a personal foul of the player and a ball, or a player with a ball out of bonds.
