

Title:

Comparing the risk behaviour of adolescents aged 16 - 17 in different secondary schools in two chosen regions

ABSTRACT:

The diploma work focuses on adolescent drug abuse and it is especially targeted on sixteen and seventeen-year-old students of secondary schools. The work is divided into theoretical and practical parts. The theoretical part is written as a literature search /recherche/, in which the targeted group is described and also the characteristics of chosen addictive drugs and risks connected to the drug abuse are introduced. In addition to this, the realised researches aimed to addictive drugs are delivered there and also at the end of this part the prevention policy is briefly entered up. In the practical part the provided researches are described. The questionnaires were handed out to students of secondary schools in Prague and Klatovy. The results are analysed and discussed in this part as well as the confrontation of results got in both places. The results confirmed that the place, or more precisely the town, does not influence the addiction to smoking cigarettes and drinking alcohol. On the contrary, talking about illegal drugs, the Prague respondents are more experienced with illegal drugs than those in Klatovy. Based on these results and other literature information there is a recommendation for the pedagogical practice drawn at the end of this work.
