

Abstract

Title: Sensation seeking tendency in freeskiing

Objectives: The aim of this work is sensation seeking tendency in freeskiing.

Methods: Were chosen due to parameters of examined group of freeskiers and required outputs. For sensation seeking tendency in freeskiing were chosen Sensation Seeking Scale form V.

Results: The comparison of our group of freeskiers with population average was detected significant differences. Statistically significant differences were detected in all 4 subscales. In sensation seeking scale are freeskiers significant different compare to population average in total score of SSS. This was caused primarily due to score of subscale TAS– thrill and Adventure seeking.

Keywords: Freeskiing, personality, experiencing, flow, sensation seeking scale
