

Abstract

Title: Sugestion on database of sports assistance for handicaped people

Objective: A suggestion to create a database of sport assistants for handicapped people. The database should reflect the needs of handicapped people as much as possible and simultaneously respect assistants' real possibilities.

Methods: In our thesis we used a descriptive research method of quantitative character containing some qualitative features. The research concentrated on 2 groups "users" and "assistants" via electronic online survey.

Results: We found out that most of the handicapped people do not have a person with whom they could do sport activity as often as wanted. It is a reason why they do sport less. The users are willing to pay for assistance more than expected. The assistants are obliging to provide more hours of assistance on the grounds of pay rise. The results offer sufficient amount of information to create a database of sport assistants for handicapped people.

Keywords: Sports assitant, assistance, adaped physical activities, disability sports
