

ABSTRACT

The aim of my thesis was to find out and compare a motion ability of children dancing Disco Dance in age bracket from six to ten years. The testing of motion abilities was carried out by means of a test battery called Unifittest (6-60) within two schools. In a top-level dancing centre Beethoven D.C. Chomutov, Municipal grammar school and primary school. The aggregate of tests was being made personally, individual performances were written down into tables and subsequently transformed into graphs. On the basis of these graphs we could later compare definite two groups of girls. In addition, I was finding out a relationship of the girls to other sports activities by means of a regulated interview.
