

Abstract

Diploma thesis Archaeozoology Klementinum in Prague studies the archaeozoological remains from the Klementinum in Prague dated between the late 11th and 15th century. The work is divided into two parts - the theoretical and the empirical part. The theoretical part focuses on the economic background of the medieval city and nutrition of its inhabitants. Other chapters focus on the historical context of Klementinum and characteristics of the archaeological research, which took place on its territory in 2012 - 2014. The research consists of material and methods and subsequent evaluation of the obtained data, which are discussed and compared with literature.

The aim of this diploma thesis is to bring interpretation of human diet of people whom lived at the site of today's Klementinum in Prague, in different time periods (from the beginning of the peak to the late Middle Ages) through the analysis of animal bones.

In conclusion this diploma thesis found the economic base of the territory and which animals have been consumed on the site. In different periods was observed increasing richness of species for documented animals. Also there was discussed the impact of arrival of the Dominican convent on the breeding economy after a year 1232nd.
