

Abstract

- Title:** Social relationships in groups on summer camp
- Objectives:** The main objective is found out which influence has summer camp in relationships between adolescences.
- Methods:** We used methods of asking, analyse and comparison. The asking was realized in two waves. The first one was at the start and the second was on the end of the summer camp method of pretest and post test). We tested 32 children in 3 groups. We used method of analyse during parsing each groups and method of comparison in part collation of conclusions. In this work we used sociometrist questionnaire B3 discovered by psychologist Richard Braun. It is based on standardized sociologist measurement (SORAD) and classic techniques (sociograms). The children in alle three groups have same programme. During this summer camp they fulfil all-camp-game, learn new skills and play games.
- Results:** We found out that level of watched sociologic indexes were lower after pass out summer camp. In all of our watched groups were found improvement in item “feeling of toleration”. We made sociograms and compare situations before and after camp. We can say that the votes were lower in the end of camp.
- Conclusion:** In all three groups there were differences between start and end of camp. We found out that all watched aspects were worse in the end. Only the “feeling of tolerance” was better – 0,17, 0,62, 0,3. We can speak about deeper relationships and on this base we can say that members of groups were more acceptable.
