

Abstract in English

This Bachelors thesis is dedicated to the major bibliographic databases in physiotherapy and mapping concepts between them. Firstly, based on the amount of important scientific journals, the most important bibliographic databases were identified and then they were analysed. That brought basic information about individual databases and about system how there are documents organised. These knowledge organisation systems were examined further with increased emphasis on concepts related to physiotherapy, especially physiotherapy techniques. Each concept was mapped across the analysed bibliographic databases and presented in a scheme, which can help to make information retrieval in those databases more efficient or as a principle for further investigation of those concepts and their relationship in medical bibliographic databases.
