Abstract

The following thesis analyses the form and importance of extreme case formulations based on more than 10 research interviews. Extreme case formulations, i.e. formulations comprising expressions such as “nothing”, “everything” or “noone“, which present a phenomenon or a circumstance according to its minimal or maximal properties, can constitute a complication in the analysis of research interviews. This thesis expand the existing hypothesis of extreme case formulations by adding new findings, for example the bipolarity of extreme case formulations. In the analysed data, these do often occur together with different classifiers, which either weaken (softeners) or strengthen (intensifiers) their extreme force. At the same time the following thesis broadens the research of extreme case formulations of interdisciplinary approach, which uses the findings from psychology and rhetoric. The conducted research is furthermore completed with the acoustic analysis of semantically extreme formulations, whose results show that extreme case formulations often tend to be acoustically emphasized.
