

Abstract (in English):

The practical part of this Bachelor's thesis is focused on making accessible of Inspection Protocol of the Theresian Cadastre from 1726 for the part of Prague called Lesser Town as a computerized database. The database should be useful for wide groups of researchers, who are interested in social, economic, demographic issues of Prague in the 18th Century or in its art-historical, especially building development.

In the theoretical part is shortly outlined the development of the oldest czech cadasters, the situation in Lesser Town of Prague after Thirty Years' War and the distinctive position of lateral rights. The aim of following chapters is briefly summarize various types of data, which are recorded in the Inspection Protocol. In each chapter I made an attempt to set a trend, which can be noticed thanks to obtained data, especially for Lesser Town.

More detailed analysis of data, which could some readers miss, would exceed the extent of Bachelor's thesis. My personal thoughts of this research are mentioned at the end of each chapter and also are outlined at the end of the work.
