Abstract
Poruchy příjmu potravy ve spojitosti s jinými diagnózami.
Eating Disorders in Connection with other Diagnoses

Bc. Marie Vavrušková

The aim of this thesis, which focuses on the topic "Eating Disorders in Connection with Other Diagnoses," is to introduce the different types of eating disorders that have been previously diagnosed (anorexia nervosa, bulimia nervosa, psychogenic overeating and new forms of eating disorders), to specify the medical treatment offered to patients in the Czech Republic, and in particular to describe what other mental or somatic disorders are most commonly associated with eating disorders.

The empirical part of the thesis presents a questionnaire which analyses the following aspects: type of eating disorder from which the clients of Centrum Anabell Praha suffer most frequently, where their medical treatment takes place, whether they suffer from another mental or somatic disorder associated with eating disorders, and whether eating disorders have a negative impact on their lives. The empirical part also presents a case report, which describes the life story, history and prognosis of a man who suffers from an eating disorder and other associated disorders.
