

The presented work is about the program DBManager, which I created. This work follows the reasons and motivations which had led to creation of the program and describes analysis preceding the creation of the program. Furthermore it describes an implementation of the program and its resulting functionality. The program DBManager is a lightweight database manager with ability to connect to the Oracle database as well as to the MS SQL Server database. The program contains the SQL console with output into the table and cooperating object browser. Results can be filtered, sorted and modified, and the modified data can be easily sent back to the database. The Object browser shows us well-arranged common database objects. The most usual database objects, such as tables or views, can be created or modified by using user friendly wizard. SQL commands as well as results of the commands can be saved and loaded from a file.
