English Abstract

The thesis deals with legal aspects of engineering construction projects performed abroad by subjects from the Czech Republic. Such projects represent the highest technical, industrial and economical skills of a nation and are crucial for national economy mainly because of their high added value. Despite the fact that each engineering project is of a unique and bespoke nature, there are issues and problems which repeat themselves more or less during the realization of every project. Therefore it is possible to identify and describe such repeated problems and issues and put them into the overall legal framework typical of engineering construction projects.
